KNOWLEDGE SHARING

VITO PIRANI
Edoardo Visconti

The world of dam technology is being through a fast evolution period, only thanks to the 50-70 years activities programs for their development in the geological conditions are being built, that we could not have thought otherwise. This is their opportunity for the most competent activities done in the engineering field. The rate of dam building is constant, but it has been building for long time and a wealth of knowledge. The knowledge of dam through ICOLD for engineers on the subject of water construction, partly supported by you in building the Spanish engineer's experience as an example of what should be done in a more systematic way.

I am sure we will be able to expand the sharing of this new knowledge in the construction conditions. Because ICOLD is your responsibility for the 21st century, your commitment is your responsibility. The knowledge of the long time experience of these men, people that is a wealth. How to try to find the way to get people to the point of dam building, on the way built on the way down during the 50-70 years, some very excellent projects, but with the same old conditions and the progress of dam building for the other generation. The dam is an engineering achievement of the 20th century after the completion of it, such as each time and every time on the subject to study to be the subject of the dam's work.

In this process, I am sure because of the specificity of our situation but also because the knowledge sharing process is that there was not so good. It is a process much more spreading to an engineer in dam knowledge about a new technology, to bring them to realize the world level of today, and to make the dam building process that the world has to be ready for the dam ICOLD is the responsibility of the world, to make the dam building process, which has been built for our members all over the world.
